

Laundry Disaster

Theme (Spin to win)

Camera

The game is a 2D side-view platformer. The camera stays fixed on the level and does not rotate, it only shakes before the rotating of the washing machine as a warning.

When the washing machine rotates, gravity flips and the entire level rotates 180°. What was the floor becomes the ceiling and vice versa.

Player Movement

The player can:

- Walk left and right.
- Jump.
- Grab zippers and hang from them.

The player can't move while the washing machine is rotating .

- This isn't like an artistic decision, It's a programming decision because having the player moving while everything is rotating 180° is going to introduce a LOT of bugs. Of course if we have time to fix these bugs I wouldn't mind to make the player moveable in time of rotations.

"Another idea I had for level design is using hoodie drawstrings.

Since there are hoodies inside the washing machine, their strings could act like ropes.

The sock could:

- Grab onto them.
- Climb up and down.
- Swing from them like Tarzan to cross gaps.
- Hold onto them during the washing machine rotations.

This would give us several gameplay mechanics using a single asset.

The drawstrings could also react to physics and sway around because of the water and the washing machine movement, making the environment feel more alive.

Combined with zippers, buttons, pockets, and shoelaces, the clothes themselves become the level design rather than having normal platforms inside a washing machine.”

****Since we're making this for a Game Jam, I strongly suggest that we don't make all of **
these mechanics mandatory from the start.**

****I think the priority should be:****

1. Walk + Jump
2. Water currents
3. Rotation mechanic
4. Soap bubbles
5. Zippers (if we still have time)
6. Hoodie drawstrings (if we have even more time)

****Swinging ropes usually require physics and a lot of tweaking to feel good, so they might**
take more time than expected. However, I think they would be a great late-game
mechanic or an optional feature if we have enough time left.**

No other movement abilities for now.

Rotation Mechanic

Every few seconds, the washing machine pauses briefly and then rotates 180°.

Before rotating, there is a short camera shake so the player has time to prepare.

Players can use this period to:

- Reach a safe platform.
- Grab a zipper.
- Position themselves for the next orientation.

Platforms

They are made of dirty clothes that you can

- Jump and stand on.
- Grab to (Zippers / hoodie drawstrings).
- Use as barriers against the water (if they are : Towels, jackets, and other large clothes).

Water (or bubbles *not sure yet*) Current

This will be mostly used in the starting levels that are easy for the player.

Certain areas contain streams of water that doesn't damage the player (it will be difference visually from the ones that damage him *maybe it will be just some splashes of water so it looks like water but not a lot of water that can carry the sock(player).)

Currents push the player in one direction. If the player doesn't fight against the current, they can be pushed into hazards.

This one may be deleted if it was hard to implement

- The direction of the water changes after each rotation because gravity changes.

Soap Bubbles

Soap bubbles are hazards that will be in the edges of the levels (because the game is always spinning this is like a kill boundary)

Touching bubbles increases the sock's cleanliness.

Bubble Pipes

Bubble pipes (or hoses) continuously release soap bubbles that block the player's path and prevent them from reaching the next obstacle or platform.

Behavior:

1. The pipe releases a stream of soap bubbles.
2. The bubbles act as a temporary barrier.
3. After a few seconds, the pipe stops producing bubbles for about 2 seconds.
4. During this short window, the player must quickly move past the pipe and continue to the next section.
5. If the player misses the opportunity, they must wait for the next pause in the bubble stream.

Gameplay:

- Bubble pipes create timing-based challenges.
- Players must observe the pattern and choose the right moment to move.
- Touching the bubbles increases the sock's cleanliness.

- Missing the opening forces the player to wait for the next cycle.

Design Goal:

Bubble pipes are meant to create predictable and fair obstacles that reward timing and patience, rather than random movement.

Flood Events

Instead of having constant water currents everywhere, the game features periodic flood events.

Flood Warning

Before a flood occurs, the washing machine gives the player a warning for about 1–2 seconds using:

- An alarm sound and/or screen shake.
- A flood meter displayed on the UI.
- A warning icon next to the meter showing the incoming water level.

This gives the player enough time to prepare before the wave arrives.

Player Responses

When a flood is coming, the player must quickly find a way to survive.

Grab a Zipper

- Hold onto a zipper until the wave passes.

Grab Hoodie Drawstrings

- Hold onto them or swing from them to avoid being swept away.

Reach Higher Ground

- Move to elevated platforms if the flood does not completely fill the area.

Hide Behind Large Clothes

- Towels, jackets, and other large clothing items can act as barriers against the water.

Level Design

This system makes the washing machine itself feel like the main enemy, rather than just a collection of unrelated obstacles.

As the player progresses through the game:

- Floods become more frequent.
- Water levels become higher.
- Safe spots become harder to reach.

It almost feels as if the washing machine itself is getting angry at this stubborn sock that refuses to get clean.

Design Benefits

Compared to constant conveyor-belt-like water currents, this system allows us to design:

- Safe zones.
- Anchor points.
- Emergency decisions.
- More interesting platforming sections.

Instead of constantly fighting against a pushing force, players are encouraged to think ahead and prepare for each incoming flood.

Dirt Meter (Basically a health system)

The player has a dirt meter, that restarts after every level.

Water and bubbles slowly clean the sock.

When the meter reaches 100% clean, the sock is swept away by the washing cycle and the player loses.

The dirt meter is shown as a simple bar on the screen that has 4 levels *basically kinda like 4 hearts (Filthy - Dirty - Suspiciously Clean - Too Clean!)

Goal

Reach the other sock before becoming completely clean.

Required Assets

Priority 1 (Must Have)

Player Sock

Sprites:

- Idle
- Walk
- Jump
- Fall

Animations:

- Idle
- Walking
- Jumping/Falling

Other Sock (Ending Character)

Sprites:

- Sad/Waiting pose
- Happy pose

Animations:

- Idle (sad)
 - Noticing the player
 - Excited reaction
 - Reunion/Hug animation
-

Human Hand (Ending)

Sprites:

- Human hand

Animations:

- Picking up both socks
 - Throwing the dirty sock back into the washing machine
-

Ending Sequence

Visual Assets:

- Washing machine door opening
- Bright outside light
- Dramatic reunion scene

Animations:

- Socks running toward each other
- Hugging animation
- Hand entering the scene
- Clean sock being taken away
- Dirty sock falling back into the washing machine

Dialogue:

"Huh? That's weird..."

"One sock is clean, but the other one is still dirty."

"Looks like this one needs another spin."

Final Screen:

"Another Spin?!"

Environment

Sprites:

- Dirty clothes platforms
- Towels
- Jackets
- Pants
- Background washing machine

Hazards

Sprites:

- Soap bubbles
- Water splash effects
- Flood wave

UI

Sprites:

- Dirt meter (4 states)
 - Filthy
 - Dirty
 - Suspiciously Clean
 - Too Clean!
- Flood meter
- Flood warning icon

Sound Effects

- Jump
- UI button
- Washing machine rotation
- Rotation warning
- Alarm sound
- Water splash
- Flood wave
- Bubble sound
- Win sound
- Lose sound

Music

Main Theme

Funny and energetic.

Flood Theme

More intense and stressful.

Ending Theme

Emotional and overly dramatic.

Priority 2 (Important)

Zippers

Sprites:

- Closed zipper
- Hanging zipper

Player Animation:

- Hanging on zipper

Large Clothes

Sprites:

- Large towel
- Hoodie
- Jacket

These can act as barriers against flood waves.

Priority 3 (Optional / If We Have Time)

Hoodie Drawstrings

Sprites:

- Drawstring rope

Player Animations:

- Climbing
- Swinging

Extra Props

Sprites:

- Buttons
- Shoelaces
- Additional clothes variations

Visual Effects

- Foam particles
- Water droplets
- Dirt particles
- Rotation screen effects

Additional Sound Effects

- Cloth movement
 - Squeaky clean sound
 - Bubble popping
 - Funny voice effects
 - Ambient washing machine sounds
-
